# Series 42 Self-operated Regulators Type 42-36 Flow Regulator

ANSI version

### Application

Regulators for district heating and extended heating systems Valves in NPS  $\frac{1}{2}$  to 10 (DN 15 to 250)<sup>1</sup>) · Pressure rating Class 125 to 300 (PN 16 to 40) · Suitable for liquids, gases and vapors from 40 to 300 °F (5 to 150 °C)<sup>2</sup>)

The valve **closes** when the flow rate rises

CE

SAMSO

The flow regulator is used to limit the flow rate in the pipeline. The set point for the flow rate is adjusted at the restriction.

## **Special features**

- Low-noise, medium-controlled proportional regulator requiring little maintenance
- Valve body available in cast iron A 126 B, cast steel A216 WCC and cast stainless steel A351 CF8M
- Suitable for circuit water, water/glycol mixtures, steam and air as well as other liquids, gases and vapors, provided these do not affect the characteristics of the operating diaphragm
- Single-seated valve with a plug balanced by a stainless steel bellows or by a balancing diaphragm

### Versions

Type 42-36 (Fig. 1)  $\cdot$  Regulators for nominal sizes NPS  $\frac{1}{2}$  to 10 (DN 15 to 250) <sup>1)</sup>  $\cdot$  Type 2423 Valve with integrated restriction for adjusting the flow rate set point  $\cdot$  Type 2426 Actuator with high-pressure control line  $\cdot$  Flange connections  $\cdot$  Balancing bellows made of CrNiMo steel or balancing diaphragm made of EPDM  $\cdot$  Valve balanced by a diaphragm NPS 6 to 10 (DN 125 or 250)

The set point ranges for the flow rate based on water listed in Table 2 apply to a differential pressure at the restriction of either 3 or 7 psi (0.2 or 0.5 bar).

### **Special versions**

- With internal parts made of FPM (FKM), e.g. for use with mineral oils
- Liquids and vapors up to max. 430 °F (220 °C)

- <sup>1)</sup> Valves in sizes larger than NPS 10 (DN 250) as well as version for steam and gases available on request
- 2) Other temperature ranges on request

**Data Sheet** 

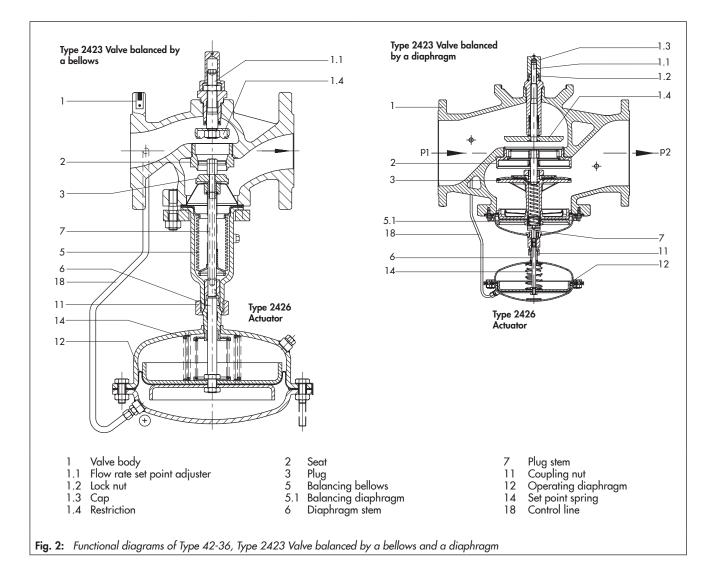

### Principle of operation (Fig. 2)

The medium flows through the valve in the direction indicated by the arrow. The flow rate is determined by the free area between the restriction (1.4) adjusted at the set point adjuster (1.1) and the valve plug (3).

In a fully balanced valve, the position of the plug is not affected by pressure changes in the medium.

The principle of operation of the regulator balanced by a bellows or diaphragm only differs concerning the pressure balancing. Valves balanced by a bellows have a balancing bellows (5), whereas the valves balanced by a diaphragm (NPS 6 to 10/DN 150 to 250) have a balancing diaphragm (5.1). The pressure directly downstream of the restriction acts on the outer surface of the metal bellows or balancing diaphragm and the downstream pressure on the inside of the bellows or diaphragm. In both cases, the forces created by the upstream and downstream pressures that act on the valve plug are balanced out. The differential pressure created at the restriction  $\Delta p_{restriction}$  operates the actuator. The pressure upstream of the restriction (1.4) is transmitted through the control line (18) to the lower diaphragm chamber. The pressure downstream of the restriction passes through the hollow plug stem (7) to the diaphragm stem (6) and then into the top diaphragm chamber.

If the flow rate increases, the differential pressure  $(\Delta p_{restriction})$  increases at the restriction and also at the operating diaphragm (12). This additional force causes the set point springs (14) to be pressed together until the forces are balanced out again. The plug starts to close. The cross-section of flow is reduced and the flow rate drops until it reaches the adjusted set point.

	m³/h	20 to 260	26 to 500	30 to 520				

The minimum required differential pressure pmin across the valve is calculated as follows:

ANSI:	$\Delta p_{min} = \Delta p_{restriction} +$	$\left( \begin{array}{c} \dot{v} \\ \hline c_v \end{array} \right)^2$	$DINp_{min} = \Delta p_{restriction} +$	$\left( \begin{array}{c} \dot{v} \\ \hline \kappa_{vs} \end{array} \right)^2$

 $\Delta p_{min} \qquad \text{Minimum differential pressure across the valve in psi (bar)}$ 

 $\Delta p_{\text{restriction}}$  Differential pressure created at the restriction for measuring the flow rate in the regulator

V Adjusted flow rate in US gal/min (m<sup>3</sup>/h)

 $C_v$  (K<sub>vs</sub>) Valve flow coefficient in US gal/min (m<sup>3</sup>/h)

#### Installation

Valve, actuator and control lines are delivered unattached.

The actuator can be easily mounted before or after the valve is installed using a coupling nut (11).

The following points must be observed:

- Install valves in horizontal pipelines.
- Direction of flow must match the direction indicated by the arrow on the body
- Install a strainer (e.g. SAMSON Type 2 NI) upstream of the valve.

# Permissible mounting positions

- All nominal sizes: Install the actuator suspended downwards (see photo)
- NPS ½ to 3 (DN 15 to 80) plus max. 250 °F (120 °C): Install the actuator either suspended or upright
- All nominal sizes with fixed plug guide and max. 250 °F (120 °C): Any position possible
- Steam applications: Always install actuator suspended downwards

Further details can be found in ► EB 3015 EN.

### Accessories

Required accessories, such as compression-type fittings, needle valves, equalizing tanks and control lines, are listed in Data Sheet T 3095 EN.
